Project SANC:

(Support of Analytic and Numeric calculations for experiments at Colliders)

Ideas and Realization

A.Andonov, A.Arbuzov, D. Bardin, S.Bondarenko,
P. Christova, L. Kalinovskaya, G. Nanava
Laboratory of Nuclear Problems, Joint Institute for Nuclear Research

OUTLINE

1. **Ideas**
2. **Basic notions**
3. **Realization:** *http://brg.jinr.ru*, or *http://pcjinr01.cern.ch*
   - **Decays** $B \to f\overline{f}$
   - **Decays** $H \to \gamma\gamma(Z\gamma, ZZ, WW), Z \to WW$
   - **Processes** $2f \to 2f$ (*talk by Lida Kalinovskaya*)
4. **Demonstration of version 0.21**

1. Ideas

- main idea of the project is to create a tool similar to CompHEP, i.e.
  - many processes ME MC generator;

  but:
  - at one-loop precision level (QED, EW, QCD);
  - keeping all external particle masses finite;
    - whenever necessary (e.g. processes with top-quark);
  - assuming REI (Reactions of Experimental Interest) criterion, i.e.
    - initial particles (electrons, photons, partons) are massless;
    - actually fermions of first generation are massless whenever possible;
- present phase assumes to reach a description of any 5 particle processes:
  - $2 \to 3$ processes;
  - $1 \to 4$ decays;
    - we prefer to say $5 \to 0$

  Of course, there is GRACE LOOP version 2.xx and many others...

Network system SANC: technical detasls

SANC SERVER

- acts as an application provider. It provides access to various applications written in several computer la guages
- provides functionality to access database servers, builds SANC-specific database structure and manipulat SANC data
- supports list of its own functions, procedures and methods (Server Functions List – SFL) and exports th list to the other SANC Servers
- provides functionality (via SOAP – PRC) to access and execute the methods from its SFL
- implements Intermediate Access Ideology
- is a user control system
- is an encrypt – decrypt system
- is an internal CVS (Concurent Versions System)

SANC CLIENT is

- a multi-purpose development environment
- a text editor
- a Database browser
- a project management tool

USED TECHNOLOGIES : JAVA, XML, SOAP

2. Basic notions

- **The Standard Model (SM) Lagrangian in the R_ξ gauge:**

$$\mathcal{L} = \mathcal{L}(\text{IPS of 25 parameters, fields, } \xi_A,\ \xi_Z,\ \xi)$$

- **Fields:** fermions, vector bosons, example of Feynman Rules

vector boson propagators:

$$A: \quad \frac{1}{p^2}\left\{\delta_{\mu\nu} + \left(\xi_A^2 - 1\right)\frac{p_\mu p_\nu}{p^2}\right\}$$

$$Z: \quad \frac{1}{p^2 + M_Z^2}\left\{\delta_{\mu\nu} + \left(\xi_Z^2 - 1\right)\frac{p_\mu p_\nu}{p^2 + \xi_Z^2 M_Z^2}\right\}$$

$$W^\pm: \quad \frac{1}{p^2 + M_W^2}\left\{\delta_{\mu\nu} + \left(\xi^2 - 1\right)\frac{p_\mu p_\nu}{p^2 + \xi^2 M_W^2}\right\}$$

- **Unphysical fields:** ϕ^0, $\phi^\pm$, Y^A, Y^Z, $X^\pm$, **the physical** H **field.**

- **Passarino–Veltman (PV) functions and reduction:**
  Presently, `SANC` knows ALL up to third rank tensorial reduction of up to four-point PV functions: A_0, B_0, and D_0; and the *auxiliary* PV functions: a_0, b_0, c_0 and d_0, which are due to particular form of photon propagator in R_ξ gauge (terms $\propto 1/p^4$).

- **A fortran library** for numerical calculation of these functions is created and thoroughly tested by means of comparison with the other codes.

Amplitude's basis, Scalar Form Factors (**SFF**), Helicity Amplitudes (**HA**)

Example of decays B(Q)$\to f(p_1)\overline{f}(p_2)$

$H \to f\overline{f}$ – $\mathcal{A} \propto I\ \mathbf{SFF_S}$

1 structure (**I–basis**), **1 SFF**, **1 HA**

$Z \to f\overline{f}$ – $\mathcal{A} \propto i\gamma_\mu\gamma_6\ \mathbf{SFF_L} + i\gamma_\mu\ \mathbf{SFF_Q} + m_f\,(p_1-p_2)_\mu\ \mathbf{SFF_D}$

3 structures (**L,Q,D–basis**), **3 SFFs**, **3 HAs**

$W \to u\overline{d}$ – $\mathcal{A} \propto i\gamma_\mu\gamma_6\ \mathbf{SFF_L} + i\gamma_\mu\gamma_7\ \mathbf{SFF_R} + m_u\,(p_1-p_2)_\mu\,\gamma_6\ \mathbf{SFF_{LD}} + m_d\,(p_1-p_2)_\mu\,\gamma_7\ \mathbf{SFF_{RD}}$

4 structures (**L,R,LD,RD–basis**), **4 SFFs**, **4 HAs**

The **3 HAs** depend on kinematical factors, coupling constants and **3 SFFs**, example of Z decay:

$$\mathbf{HA^Z_{0++}} = \mathbf{HA^Z_{0--}} = \frac{gm_f}{c_W}\left[a_f\ \mathbf{SFF_L} + \delta_f\ \mathbf{SFF_Q} + \frac{1}{2}a_f\beta_f^2M_Z^2\ \mathbf{SFF_D}\right]$$

$$\mathbf{HA^Z_{++-}} = \frac{gM_Z}{\sqrt{2}c_W}\left[a_f(1-\beta_f)\ \mathbf{SFF_L} + \delta_f\ \mathbf{SFF_Q}\right]$$

$$\mathbf{HA^Z_{--+}} = \frac{gM_Z}{\sqrt{2}c_W}\left[a_f(1+\beta_f)\ \mathbf{SFF_L} + \delta_f\ \mathbf{SFF_Q}\right]$$

$$\beta_f^2 = 1-4\frac{m_f^2}{M_Z^2}, \qquad \delta_f = v_f - a_f = -2Q_fs_W^2, \qquad a_f = I_f^{(3)}.$$

Amplitude's basis, Scalar Form Factors (**SFF**), Helicity Amplitudes (**HA**), contd.

Example of decays H(Q)$\to V(p_1)V(p_2)$ $[V=\gamma, Z]$

$$H\to\gamma\gamma \;-\; \mathcal{A}\propto\left(\delta_{\mu\nu}-2\frac{p_{1\nu}p_{2\mu}}{M_H^2}\right)\epsilon^1_\mu\epsilon^2_\nu\;\mathbf{SFF}_{\gamma\gamma}\,,\qquad \text{1 structure, } \mathbf{1\ SFF},\ \mathbf{1\ HA}$$

$$H\to Z\gamma \;-\; \mathcal{A}\propto\left[\left(1-\frac{M_Z^2}{M_H^2}\right)\delta_{\mu\nu}-2\frac{p_{1\nu}p_{2\mu}}{M_H^2}\right]\epsilon^1_\mu\epsilon^2_\nu\;\mathbf{SFF_{Z\gamma}}\,,\qquad \text{1 structure, } \mathbf{1\ SFFs},\ \mathbf{1\ HA}$$

$$H\to ZZ \;-\; \mathcal{A}\propto\left(\delta_{\mu\nu}\,\mathbf{SFF^d_{ZZ}}+\frac{p_{1\nu}p_{2\mu}}{M_H^2}\,\mathbf{SFF^p_{ZZ}}\right)\epsilon^1_\mu\epsilon^2_\nu\,,\qquad \text{2 structures, } \mathbf{2\ SFFs},\ \mathbf{2\ HAs}$$

Example of **2 HAs** for $H\to ZZ$ decay depending on **2 SFFs** (only non-zero **HAs** are shown):

$$\mathbf{HA^H_{++}=HA^H_{--}}\;\propto\;-\,\mathbf{SFF_d}$$

$$\mathbf{HA^H_{00}}\;\propto\;\left[\left(-1+\frac{1}{2}\frac{M_H^2}{M_Z^2}\right)\mathbf{SFF^d_{ZZ}}+\left(-1+\frac{1}{4}\frac{M_H^2}{M_Z^2}\right)\mathbf{SFF^p_{ZZ}}\right]$$

From analytic results to numbers

$$d\Gamma(d\sigma) \sim \sum_{\lambda_i\lambda_j\lambda_k\lambda_l} \left| \mathbf{HA}(\mathbf{SFF}^{\mathbf{Born+1-loop}})_{\lambda_i\lambda_j\lambda_k\lambda_l} \right|^2$$

$$d\Gamma(d\sigma) \sim \sum_{\lambda_i\lambda_j\lambda_k\lambda_l} \left| \mathbf{HA}(\mathbf{SFF}^{\mathbf{Born+1-loop+2-loop}})_{\lambda_i\lambda_j\lambda_k\lambda_l} \right|^2$$

A. Ferroglia, G. Passarino, M. Passera, S. Uccirati, Nucl.Phys. B650 (2003) 162-228

+ Soft bremsstrahlung

+ Hard bremsstrahlung either from an analytic calculations

or from a (partner) MC, e.g. WINHAC

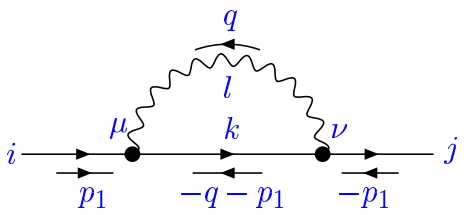
ANNEX

1. **Examples of precomputation chains**

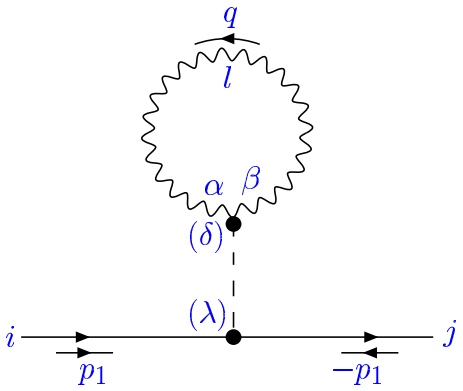
2. **Classification of processes in the SM**

3. **Examples of some $2 \to 2$ and $2 \to 3$ hard processes**

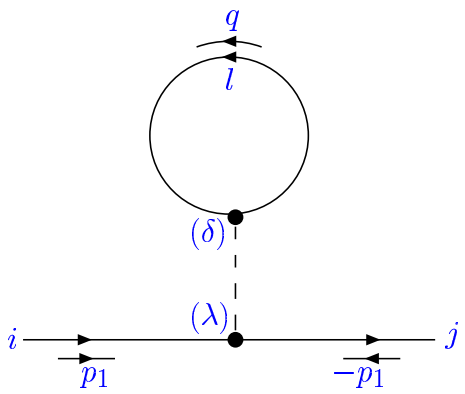
Chain: Self → Fermion → Fermion Self



Two point fermionic diagrams.

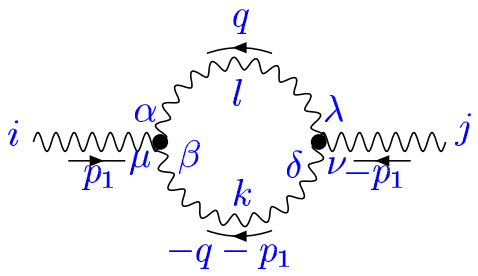


Tadpoles: bosonic part,

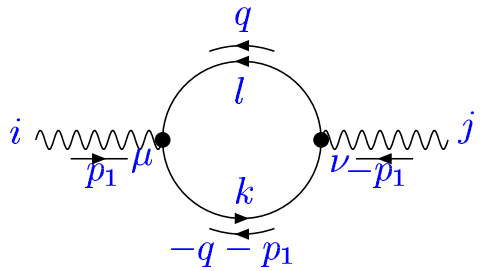


fermionic part

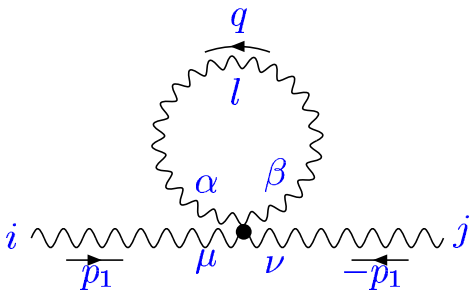
Chain: Self → Boson → Boson Self



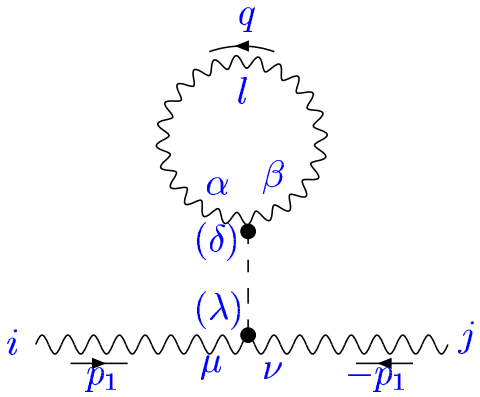
Two point bosonic diagrams,



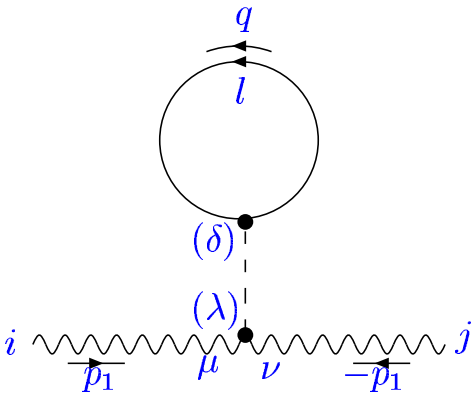
fermionic component



One point bosonic diagrams.

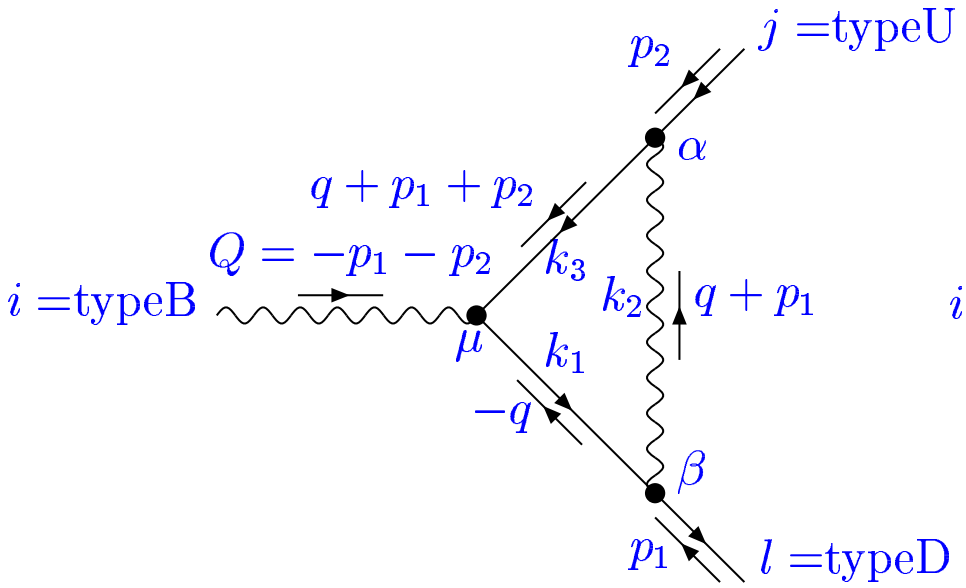


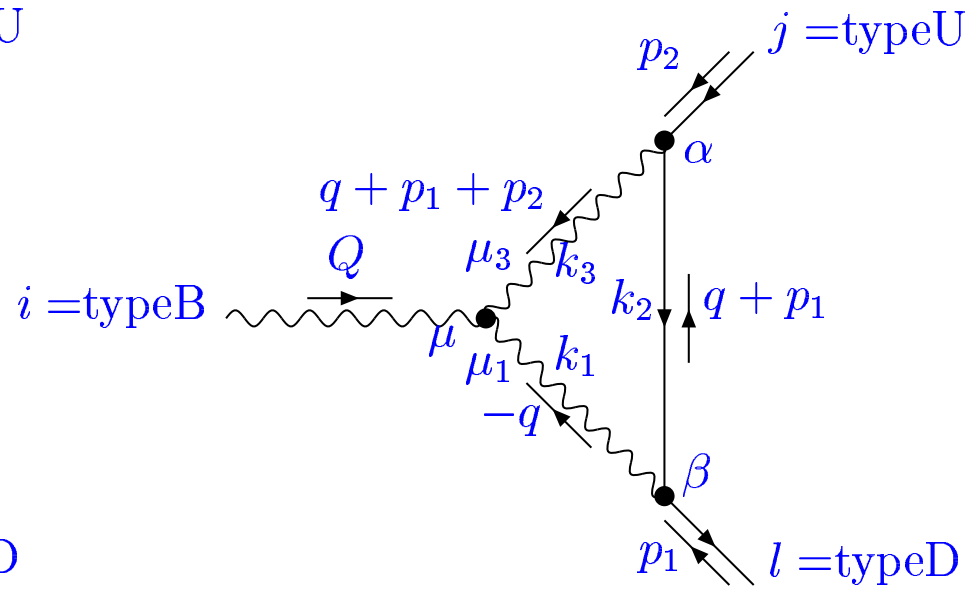
Tadpoles: bosonic part,



fermionic part

Chain: **Vertex** → **Bff** → **B→ff**





Vertices: FBF-topology, BFB-topology.

Classification of processes in the SM

1. PROCESSES $3 \to 0$

- $Bf\bar{f} \to 0$ decays
  - $H \to f\bar{f}$ $\longrightarrow$ 1 scalar form factor (SFF)
  - decay $Z \to f\bar{f}$ and transition $\gamma^* \to f\bar{f}$ $\longrightarrow$ 3 (SFF)
  - decay $W \to f\bar{f}'$ and crossing-channel $t \to W^+b$ $\longrightarrow$ 4 (SFF)
- $3B \to 0$ decays and fusions
  - decays $H \to \gamma\gamma$, $H \to Z\gamma$, $H \to ZZ$, W^+W^- $\longrightarrow$ correspondingly 1,1,2,2 (SFF)
  - fusion $2 \to 1$
    dominant Higgs boson production channel at hadronic colliders $gg \to H$
  - virtual transitions $Z^* \to W^+W^-$ and $\gamma^* \to W^+W^-$
    "building blocks" for more complicated processes

Decay rates are typical pseudo-observables.

2. PROCESSES $4 \to 0$

- **Processes 4f $\to$ 0**
  - **Neutral Current (NC): $f\bar{f} \to (\gamma, Z, H) \to f'\bar{f}'$**
    $\longrightarrow$ 4 SFF (for massless fermions) & $\longrightarrow$ 10 SFF (for massive fermions)
  - **Charged Current (CC):**
    - **$f_1\bar{f}_2 \to (W) \to f_3\bar{f}_4$ $\longrightarrow$ 16 SFF (all fermions are massive)**
    - **$F \to 3f$ — μ, τ decays, $t \to bu\bar{d}$**
    - **partonic processes at hadron colliders, for instance: $q_i + \bar{q}_j \to \bar{b} + t$ $(b + \bar{t})$**
- **Processes 2B2f $\to$ 0**
  - **Compton effect: $\gamma e \to \gamma e$**
  - **radiative decays: $Z \to f\bar{f}\gamma$, $H \to f\bar{f}\gamma$**
  - **$e^+e^- \to W^+W^-$, ZZ, $Z\gamma, \gamma\gamma$**
  - **partonic processes at hadron colliders, for instance: $q_i + \bar{q}_j \to W(Z) + H$**
- Processes **4B $\to$ 0**
  - light-by-light scattering: $\gamma\gamma \to \gamma\gamma$
  - virtual transitions **$ZZ \to ZZ$** (and many others)

3. PROCESSES $5 \to 0$

- **Processes 4fB $\to$ 0**
  - **radiative $f\bar{f}\gamma$ production in e^+e^- annihilation: $e^+e^- \to f\bar{f}\gamma$**
  - **or some partonic processes at LHC:**

$$g + q_i \to q_j + \bar{b} + t\,,$$
$$q_i + q_i \to q_j + q_j + H$$

  - **or Higgs decay into four leptons (muons):**

$$H \to \mu^+ + \mu^- + \mu^+ + \mu^-$$

- **Processes 3B2f $\to$ 0**
  - **one more well-known partonic process at LHC:**

$$g + g \to t + \bar{t} + H$$

  - ...

- **Processes 5B $\to$ 0 ...**

4. PROCESSES $6 \to 0$ ...
